```
Hide
```

```
if(!require("EBImage")){
  source("https://bioconductor.org/biocLite.R")
  biocLite("EBImage")
if(!require("R.matlab")){
  install.packages("R.matlab")
if(!require("readxl")){
  install.packages("readxl")
if(!require("dplyr")){
  install.packages("dplyr")
}
if(!require("readxl")){
  install.packages("readxl")
}
if(!require("ggplot2")){
  install.packages("ggplot2")
if(!require("caret")){
  install.packages("caret")
if(!require("gbm")){
  install.packages("gbm")
library(R.matlab)
library(readxl)
library(dplyr)
library(EBImage)
library(ggplot2)
library(caret)
library(gbm)
```

Step 0 set work directories

```
set.seed(0)
setwd("~/Documents/GitHub/Spring2020-Project3-group4/doc")
Hide
```

```
train_dir <- "../data/" # This will be modified for different data sets.
train_image_dir <- paste(train_dir, "images/", sep="")
train_pt_dir <- paste(train_dir, "points/", sep="")
train_label_path <- paste(train_dir, "label.csv", sep="")</pre>
```

Step 1: set up controls for evaluation experiments.

In this chunk, we have a set of controls for the evaluation experiments.

- (T/F) cross-validation on the training set
- (number) K, the number of CV folds
- (T/F) process features for training set
- (T/F) run evaluation on an independent test set
- (T/F) process features for test set

```
Hide
```

```
run.cv=TRUE # run cross-validation on the training set
K <- 5 # number of CV folds
run.feature.train=TRUE # process features for training set
run.test=TRUE # run evaluation on an independent test set
run.feature.test=TRUE # process features for test set
```

Using cross-validation or independent test set evaluation, we compare the performance of models with different specifications. In this Starter Code, we tune parameter k (number of neighbours) for KNN.

Step 2: import data and train-test split

Hide

```
#train-test split
info <- read.csv(train label path)</pre>
n <- nrow(info)</pre>
n train \leftarrow round(n*(4/5), 0)
train idx <- sample(info$Index, n train, replace = F)</pre>
test idx <- setdiff(info$Index,train idx)</pre>
```

If you choose to extract features from images, such as using Gabor filter, R memory will exhaust all images are read together. The solution is to repeat reading a smaller batch(e.g 100) and process them.

Hide

```
n files <- length(list.files(train image dir))</pre>
image list <- list()</pre>
for(i in 1:100){
   image list[[i]] <- readImage(paste0(train image dir, sprintf("%04d", i), ".jpg"))</pre>
}
```

Fiducial points are stored in matlab format. In this step, we read them and store them in a list.

```
#function to read fiducial points
#input: index
#output: matrix of fiducial points corresponding to the index
#readMat.matrix <- function(index){</pre>
      return(round(readMat(paste0(train pt dir, sprintf("%04d", index), ".mat"))
[[1]],0))
#}
#load fiducial points
#fiducial pt list <- lapply(1:n files, readMat.matrix)</pre>
#save(fiducial pt list, file="../output/fiducial pt list.RData")
load("../output/fiducial pt list.RData")
```

Step 3: construct features and responses

- The follow plots show how pairwise distance between fiducial points can work as feature for facial emotion recognition.
- In the first column, 78 fiducials points of each emotion are marked in order.
- In the second column distributions of vertical distance between right pupil(1) and right brow peak(21) are shown in histograms. For example, the distance of an angry face tends to be shorter than that of a surprised face.
- The third column is the distributions of vertical distances between right mouth corner(50) and the midpoint of the upper lip(52). For example, the distance of an happy face tends to be shorter than that of a sad face.

feature.R should be the wrapper for all your feature engineering functions and options. The function feature() should have options that correspond to different scenarios for your project and produces an R object that contains features and responses that are required by all the models you are going to evaluate later.

- feature.R
- · Input: list of images or fiducial point
- Output: an RData file that contains extracted features and corresponding responses

Hide

```
source("../lib/feature.R")
tm_feature_train <- NA
if(run.feature.train){
   tm_feature_train <- system.time(dat_train <- feature(fiducial_pt_list, train_idx))
}
tm_feature_test <- NA
if(run.feature.test){
   tm_feature_test <- system.time(dat_test <- feature(fiducial_pt_list, test_idx))
}
save(dat_train, file="../output/feature_train.RData")
save(dat_test, file="../output/feature_test.RData")</pre>
```

Step 4: Train a classification model with training features and responses

Call the train model and test model from library.

train.R and test.R should be wrappers for all your model training steps and your classification/prediction steps.

- train.R
- · Input: a data frame containing features and labels and a parameter list.
- · Output:a trained model
- test.R
- Input: the fitted classification model using training data and processed features from testing images
- Input: an R object that contains a trained classifier.
- · Output: training model specification

```
shrink = c(0.10,0.05,0.01)
model_labels = paste("GBM with Shrink =", shrink)
```

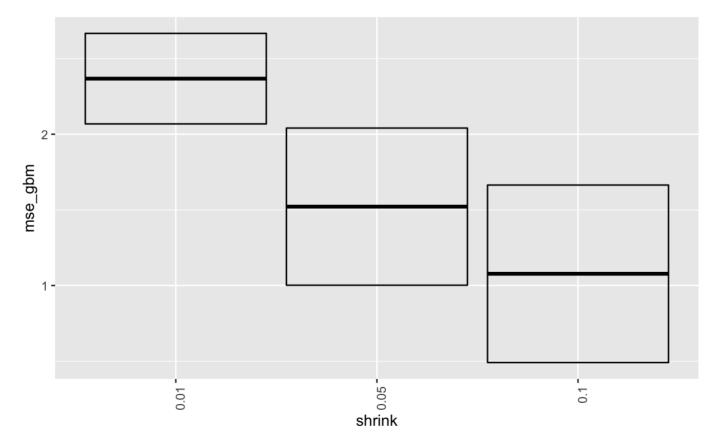

cross-validation to choose shrink parameter

Hide

```
#source("../lib/tuning_parameter_gbm.R")
#if(run.cv){
#    err_cv_gbm <- matrix(0, nrow = length(shrink), ncol = 2)
#    for(i in 1:length(shrink)){
#        cat("Shrink =", shrink[i], "\n")
#        err_cv_gbm[i,] <- cv.function.gbm(dat_train, shrink[i])
#        save(err_cv_gbm, file="../output/err_cv_gbm.RData")
#    }
# }</pre>
```

Visualize cross-validation results.

Hide

· Choose the "best" parameter value

```
if(run.cv){
  model_best_gbm <- shrink[which.min(err_cv_gbm[,1])]
}
par_best_gbm <- list(shrink = model_best_gbm)</pre>
```

• Train the model with the entire training set using the selected model (model parameter) via cross-validation.

Hide

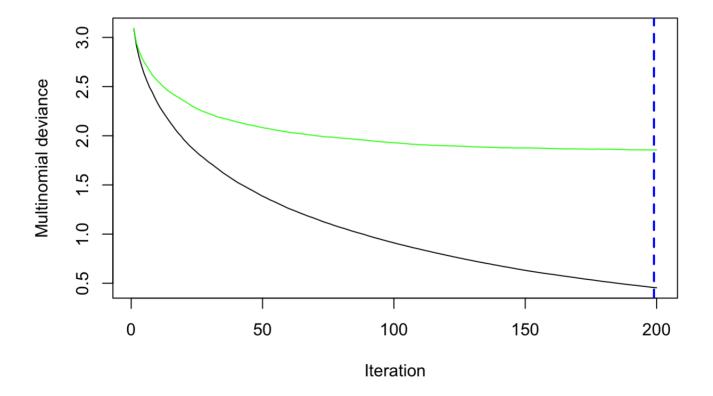

```
source("../lib/train_gbm.R")
###Traing
#gbm.fit<-gbm_train(dat_train)
#Save model
#saveRDS(gbm.fit, "../output/gbm.RDS")

#Google Drive link: https://drive.google.com/file/d/16ZQ-hkR1sJURZNX_NIpXcOsRSNsXgwy
C/view?usp=sharing
#load model
gbm.fit<-readRDS("../output/gbm.RDS")</pre>
```

Step 5: Run test on test images

Hide

```
source("../lib/test_gbm.R")
pred_gbm<-gbm_test(gbm.fit[[1]],dat_test)</pre>
```

Evaluation

pred.class<-apply(pred_gbm[[1]],1,which.max)
confusionMatrix(dat_test\$emotion_idx,as.factor(pred.class))</pre>

▼ Part 1: Import Data

```
#####get the file shareable link = https://drive.google.com/open?id=loliwM2-sH8CD_3q3
#####The file ID is the letter after "id=".

#####please replace the id of your file
download = drive.CreateFile({'id': 'loliwM2-sH8CD_3q3yUbLF836U9Al-Lc0'})
download.GetContentFile('train_set.zip')
!unzip train_set.zip

#####Run the code, and go to the URL in th output, enter the authorization code, done
from google.colab import drive
drive.mount('/content/drive')
```

Drive already mounted at /content/drive; to attempt to forcibly remount, call dri

▼ I. Our Advanced Model

We are using PCA with Bagging-SVM as our Advacned Model

Notation on These functions:

1. extract_mat():

TAKES IN a list returned by a loadmat function.

RETURN an array that have all the points in the mat file.

2. get_f():

TAKES IN a direction that contains a *single* .mat file.

RETURN an ndarray contains the pairwise euclidian distance between the coordinate contains i

3. feature_extraction():

TAKES IN a direction that contains the direction that contains all the .mat file for the train.

RETURNS a ndarray contains the train_x with features set as pairwise euclidian distance between contains in the .mat file.

4. f_pca():

TAKES IN a ndarray contains all the train_x.

RETURNS a ndarray contains decomposed x and the decompositon model.

5. BaggingSVM_w_pca():

TAKES IN two ndarrays as train_x(without decomposition) and train_y.

RETURNS the SVM-Bagging model trained with decomposed-train_x and train_y.

claim_possible_acc_BSVM():

TAKES IN three arguments which is the direction that contains _all_the .mat file for x, the directinamed *label.csv* that have a column named as emotion_idx as the train_y.

RETURNS the possible accuracy of the Logistic-Bagging model.

   Our model should have about 52.2533% accuracy
```

After doing some test, we can claim that Our Advanced Model would have 52.25% Accuracy.

The train time for our Advanced Model is about 110 seconds

You can use The Code below to train the model on the whole train data set

```
y = pd.read_csv('train_set/label.csv').emotion_idx
advanced_model, pca_sub_model = BaggingSVM_w_pca(X, y)

Feature Extraction Completed!
   Feature Extraction Cost: 0.82 Seconds
   The Decomposition take up 1.00% Information of original Data
   The Time for train is: 322.94 Seconds
```

Then, you can use the code below to test on the test set

X = feature extraction('train set/points')

```

▼ III. BAGGING-LOG MODEL

Notation on These functions:

1. extract_mat():

TAKES IN a list returned by a loadmat function.

RETURN an array that have all the points in the mat file.

2. get_f():

TAKES IN a direction that contains a *single* .mat file.

RETURN an ndarray contains the pairwise euclidian distance between the coordinate contains i

feature_extraction():

TAKES IN a direction that contains the direction that contains *all* the .mat file for the train.

RETURNS a ndarray contains the train_x with features set as pairwise euclidian distance between contains in the .mat file.

4. f_pca():

TAKES IN a ndarray contains all the train_x.

RETURNS a ndarray contains decomposed x and the decompositon model.

5. BaggingLR_w_pca():

TAKES IN two ndarrays as train_x(without decomposition) and train_y.

RETURNS the Logistic-Bagging model trained with decomposed-train_x and train_y.

6. claim_possible_acc_BL():

TAKES IN three arguments which is the direction that contains _all_the .mat file for x, the directinamed *label.csv* that have a column named as emotion_idx as the train_y.

RETURNS the possible accuracy of the Logistic-Bagging model.

```

                             5 out of
                                                                           0.0s
```

The accuracy of Bagging-Logistic model may be a bit higher (53.6%) than our advanced model but aft model is not as stable as our advanced model.
